ABSTRACT

A digital computer program for the geometrically nonlinear analysis of totally arbitrarily loaded shells of revolution (SATANS-II) was modified to more accurately account for the conditions at the pole of the shell. This program was used to determine the buckling load of shallow spherical shells of various sizes when subjected to static axisymmetric, dynamic axisymmetric, and dynamic nearly axisymmetric step-pressure loads of infinite duration. A comparison was made between the new buckling results and previous results obtained without the new pole routine. The comparison revealed a significant change in the buckling pressures, due solely to the change in the pole routine. The new static axisymmetric, dynamic axisymmetric, and even the dynamic asymmetric critical buckling pressure loads appear to be fairly reliable results for perfect, shallow shells.

TABLE OF CONTENTS

LIST OF SYMBOLS

b = nondimensional inplane stiffness

E = the modulus of elasticity of the shell

H = the rise of the spherical cap at the pole

h = the thickness of the shell

m = the mass density of the shell

M_s = the meridional bending moment per unit length

n = the Fourier index

P = a nondimensional applied load

P_{CRIT} = the nondimensional critical pressure

q_o = the classical buckling pressure of a complete sphere

$q^{(n)}$ = a column matrix containing the coefficients of the n^{th} term in the series expansion of the applied load

r = the normal distance from the axis of revolution to the surface of the cap

r_o = the normal distance from the axis to the cap in the base plane; the maximum value of r

R_s, R_θ = the radii of curvature in the s and θ directions, respectively

s = the meridional distance along the surface of the shell

t = the nondimensional time

T = the time

T_o = a reference time

U, V, W	=	the displacements in the s, θ and ζ directions, respectively
u, v, w	=	nondimensional series coefficients of U, V, W
$\bar{V}$	=	a nondimensional measure of the volume of the shell deformation
$\bar{V}_{MAX}$	=	the peak in the time history of the parameter $\bar{V}$
$W^{(n)}$	=	the displacement in the ζ direction in the n^{th} harmonic
δt	=	the nondimensional time increment
	=	distance between stations
$\epsilon^{(n)}$	=	the nondimensional parameter governing the magnitude of the load applied in the asymmetric harmonics
ζ	=	the coordinate normal to the surface of the shell
θ	=	the circumferential angle measured about the axis of revolution
λ	=	a nondimensional geometric parameter used to describe the spherical cap
ν	=	Poisson's ratio
ξ	=	the normal distance from the base plane to the middle surface of the undeformed cap

ACKNOWLEDGEMENT

I wish to acknowledge the help that I have received in the course of my thesis research.

I am particularly indebted to Professor Robert E. Ball, who provided me with the guidance and aid necessary to complete my project.

I am also grateful to Professor Johann Arbocz of CALTECH, who provided the initial deck of cards from which I worked.

I also wish to give credit to the NPS programming consultants, and in particular Richard Donat, for the expert assistance he provided in debugging my changes to the computer program.

I especially want to express my sincere appreciation to my wife, Roberta, for her patience and assistance in typing of this thesis.

I. INTRODUCTION

In 1973 a digital computer study was presented by Ball and Burt [1] for the dynamic buckling load of clamped shallow spherical shells subjected to axisymmetric and nearly axisymmetric step-pressure loads. A static buckling analysis of the same spherical shells had been carried out in 1970 by Stilwell and Ball [2]. In these two studies the digital computer program SATANS-I [3] was used to calculate the critical buckling pressures for a large range of shell sizes. Other studies of the buckling of shallow shells have been conducted by Huang [4,5], by Stephens and Fulton [6], by Lock et al. [7], by Stricklin [8], and most recently by Akkas [9]. In Reference 1 the results from these other studies, except for those by Akkas, are compared with the results from SATANS-I for both static and dynamic buckling. In the axisymmetric static analysis the comparison with the results obtained by Huang [4] revealed that the SATANS-I results were higher than Huang's results for several shell sizes. In the dynamic, axisymmetric buckling analysis the SATANS-I results again either agreed closely with, or were somewhat higher than , the results by Huang [5], Stephens and Fulton [6], and Stricklin [8]. However, it was noted then that there was a general lack of consistent agreement among any of the sets of results. As a consequence, it appeared at that time that the axisymmetric buckling problem had not yet been totally resolved and that additional studies would be appropriate.

In the asymmetric dynamic buckling analysis of Reference 1 the few comparisons that could be made for the critical load also indicated that the SATANS-I results may be too

high. A comparison of the recent estimates for the asymmetric dynamic buckling load obtained by Akkas [9] with the SATANS-I results also reveals the SATANS-I results to be well above those of Akkas [9]. However, it should be noted that the results obtained by Akkas were from his attempt to obtain a lower bound on the critical asymmetric load. This bound on the buckling load is obtained without the execution of a complete transient response analysis on the asymmetric part of the response of the shell, as is done in SATANS-I. In Akkas' analysis (Problem 1) the transient nonlinear axisymmetric response is computed, and a determinant is examined for possible bifurcation into asymmetric motion at each time step. The minimum load at which the determinant becomes zero is defined as the lower bound of the critical load.

As a consequence of the generally high buckling loads predicted by SATANS-I, a re-examination of the static and dynamic buckling of the shallow spherical shell was made in an attempt to determine the possible cause, or causes, of the high buckling loads. In our search we discovered that a modification of the manner in which the pole conditions are numerically approximated significantly lowered the buckling loads to values that are now in good agreement with the other results. The new procedure for handling the pole condition is given in section III of this thesis. The new buckling results are given in section V.

In addition to the pole condition modifications and the new buckling results the author has also made another significant change to the SATANS family of codes. In particular, the SATANS-II program for the geometrically nonlinear analysis of totally arbitrarily loaded shells of revolution, developed by Ryan [10] in 1972 to handle more complex and larger problems, was modified to make the computer memory requirement a variable quantity. This

quantity is specified by the user to fit the particular problem being run. It eliminates the large core requirement of SATANS-II for small problems and allows for much larger problems to be solved than could be solved by SATANS-II. The new program with the pole condition and memory modifications will hereafter be called SATANS-IIA. It is described in section II.

II. DESCRIPTION OF SATANS-IIA

SATANS-II was developed by Ryan [10] from SATANS-I and incorporated the full trigonometric expansion of the applied load and solution vector, and introduced the handling of imperfections into the code. These modifications allow the analysis of shells under totally arbitrary loads, as well as imperfection studies on actual shells with measured imperfections [11]. Unfortunately, the original deck of cards for SATANS-II was destroyed. Professor Johann Arbocz of CALTECH had a listing of SATANS-II and punched a deck of cards with the changes to SATANS-I given in that listing. A copy of this deck was sent to Professor Ball. These cards have been added by the author to the original SATANS-I described by Ryan [10] and a complete version of SATANS-II has been reconstructed. SATANS-IIA is a modification by the author of the reconstructed SATANS-II program. A listing of SATANS-IIA can be found in Appendix A. The listing contains an example problem for the dynamic analysis of a clamped, truncated cone subjected to an impulsive loading which is uniform along the meridian and varies in a cosine distribution over one-half of the circumference. This problem is a sample problem suggested by the Lockeed Missiles and Space Corp. [12]. A condensed version of the output from the example problem is given in Appendix B. Input data preparation for SATANS-IIA can be found in Appendix C. The basic users manual, which includes preparation of input subroutines and the theory of the program, is contained in Reference 3, which can be obtained through COSMIC (M70-10098, LAR-10736), or ASIAC [13]. A users manual which includes preparation and handling of imperfection data within the SATANS programs can be found in

Ref. [10]. The above information, along with the following discussion, will inform the user on the capabilities and proper use of SATANS-IIA.

The modification of the SATANS-II program to make its core requirement variable was accomplished by putting in a single dimension statement at the beginning of the program, with subsequent dimensioning within the subroutines to only the first element of the vector or matrix. This is a convenient feature of the FORTRAN-IV language in which the program is written. The actual vector and matrix sizes are transmitted to the subroutines by an individual parameter list. Construction of the initial dimension statement and core request size is as follows:

The basic size of the program on the IBM-360/67 Digital Computer, without the initial dimension statement, is 272,000 bytes. This figure includes approximately 19,000 bytes of buffer space required for execution. Within the main dimension statement are fifteen variables. However, only three parameters are needed to specify the sizes of these fifteen variables.

Let a= The number of stations along the meridian of the shell times the number of harmonics considered.

Let b= a, plus two fictitious stations times the number of harmonics considered.

Let c= The number of harmonics considered.

The main dimension statement would then be constructed as,

```
DIMENSION P(4,4,a), DEE(4,4,a), DST(4,4,a), X(4,a),
          PHIXB(a), PHITB(a), Z(4,b), ZO(4,b),
          Z2(4,b), Z3(4,b), ZDOT(4,b), IS(99,c),
          JS(99,c), ID(99,c), JD(99,c)
```

The 99's above limit the user to 99 harmonics in any one run and an unlimited number of meridional stations. The core requirement for the general case would be,

272,000 + 216a + 80b + 1584c = bytes of core required.

For a sample calculation of the core requirements consider the example of a spherical cap with 40 stations along the meridian, and an asymmetric analysis with two harmonics. Therefore,

a= 40(stations) x 2(harmonics) = 80

b= 80 + 2 x 2(harmonics) = 84

c= 2(harmonics)

Thus, for the variables P, DEE, DST,

3 x (4x4x80) = 3840 (words) x 4 = 15,360 bytes

for the variable X,

4 x (80) = 320 (words) x 4 = 1280 bytes

for the varibles PHIXB, PHITB,

2 x (80) = 160 (words) x 4 = 640 bytes

for the varibles Z, ZO, Z2, Z3, ZDOT,

5 x (4x84) = 1680 (words) x 4 = 6720 bytes

lastly, for the varibles ID, JD, IS, JS,

4 x (99x2) = 792 (words) x 4 = 3168 bytes

Therefore, the total size of the main dimension statement would be 27,168 bytes. This figure would be rounded up to the nearest even thousand bytes, i.e. 28,000 bytes. Finally, the core requirement for this example problem would be

272,000 + 28,000 = 300,000 bytes.

III. IMPROVED POLE ROUTINE

The SATANS code is based upon Sander's geometrically nonlinear equations under the conditions of small strains and moderately small rotations. The formulation is in four second order nonlinear partial differential equations in terms of U, V, W, and M_s, where U, V, and W are the meridional, circumferential and normal displacements respectively, and M_s is the meridional bending moment. The nonlinear partial differential equations in the coordinates s, θ, and t are reduced to uncoupled sets of linear differential equations in s and t by expanding the variables in trigonometric series in the circumferential coordinate θ, and treating the nonlinear terms as pseudo loads. The first and second derivatives in the meridional coordinate s are replaced by the conventional central finite difference approximations, i.e.

$$\{z\}'_i = 1/2\Delta \left(\{z\}_{i+1} - \{z\}_{i-1}\right) \tag{1}$$

and

$$\{z\}''_i = 1/\Delta^2 \left(\{z\}_{i+1} - 2\{z\}_i + \{z\}_{i-1}\right) \tag{2}$$

where $\{z\}_i$ is the vector of U, V, W, and M_s at the i^{th} station, Δ is the uniform dimension between stations, and primes denote partial derivatives with respect to s. Applying these approximations to the governing set of domain

equations leads to

$$[C]_i \{z\}_{i-1} + [B]_i \{z\}_i + [A]_i \{z\}_{i+1} = \{g\}_i \tag{3}$$

When the shell does not have a pole, fictitious stations one increment off of the shell are introduced at each end. Both the governing domain equations and the boundary conditions are applied at the two boundary points. Thus, all finite difference approximations to the derivatives, including those of the boundary conditions, are of order Δ^2. However, prior to the development of SATANS-IIA, the treatment of the conditions to be applied at a pole at either end of a shell was handled by a simple Euler forward or backward difference approximation to the first derivative, with truncation error of order Δ. For example, for a pole at s= 0, where i= 1, the first derivative at the pole was approximated with

$$\{z\}'_1 = 1/\Delta \; (\{z\}_2 - \{z\}_1). \tag{4}$$

At the time this procedure for handling the pole conditions was developed (1967) it was thought that this would not significantly alter the solution. However, it has since been discovered that such is not the case.

For the new pole routine, an expanded forward difference approximation of order Δ^2 is used at s= 0 which takes into account the two stations after the pole, instead of just one station after the pole as in the Euler scheme. This approximation is

$$\{z\}'_1 = 1/2\Delta \; (-3\{z\}_1 + 4\{z\}_2 - \{z\}_3). \tag{5}$$

The conditions to be imposed upon the dependent variables at a pole are derived in Reference 14. They are :

For N= 0, $u_1 = v_1 = w'_1 = m'_{s1} = 0.$

Applying equation (5), these conditions can be put into the matrix form

$$\begin{bmatrix} 1 & 0 & 0 & 0 \\ 0 & 1 & 0 & 0 \\ 0 & 0 & -3 & 0 \\ 0 & 0 & 0 & -3 \end{bmatrix} \begin{Bmatrix} u \\ v \\ w \\ m_s \end{Bmatrix}_1 + \begin{bmatrix} 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 \\ 0 & 0 & 4 & 0 \\ 0 & 0 & 0 & 4 \end{bmatrix} \begin{Bmatrix} u \\ v \\ w \\ m_s \end{Bmatrix}_2 + \begin{bmatrix} 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 \\ 0 & 0 & -1 & 0 \\ 0 & 0 & 0 & -1 \end{bmatrix} \begin{Bmatrix} u \\ v \\ w \\ m_s \end{Bmatrix}_3 = 0.$$

where the above 3 matrices are DL, DG, and DF within the SATANS programs.

For N= 1, $u_1 \pm v_1 = u' = w = m_s = 0,$

where the plus sign applies at an initial pole, and the minus sign at a final pole. The matrix form for these conditions is

$$\begin{bmatrix} -3 & 0 & 0 & 0 \\ 1 & \pm 1 & 0 & 0 \\ 0 & 0 & 1 & 0 \\ 0 & 0 & 0 & 1 \end{bmatrix} \begin{Bmatrix} u \\ v \\ w \\ m_s \end{Bmatrix}_1 + \begin{bmatrix} 4 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 \end{bmatrix} \begin{Bmatrix} u \\ v \\ w \\ m_s \end{Bmatrix}_2 + \begin{bmatrix} -1 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 \end{bmatrix} \begin{Bmatrix} u \\ v \\ w \\ m_s \end{Bmatrix}_3 = 0.$$

For N=2, $u = v = w = m'_s = 0$

the matrix form is

$$\begin{bmatrix} 1 & 0 & 0 & 0 \\ 0 & 1 & 0 & 0 \\ 0 & 0 & 1 & 0 \\ 0 & 0 & 0 & -3 \end{bmatrix} \begin{Bmatrix} u \\ v \\ w \\ m_s \end{Bmatrix}_1 + \begin{bmatrix} 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 4 \end{bmatrix} \begin{Bmatrix} u \\ v \\ w \\ m_s \end{Bmatrix}_2 + \begin{bmatrix} 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & -1 \end{bmatrix} \begin{Bmatrix} u \\ v \\ w \\ m_s \end{Bmatrix}_3 = 0.$$

For N > 2, $u = v = w = m_s = 0$

and DL= identity matrix, DG= DF= null matrices.

The sclution procedure in SATANS is an elimination scheme and starts with

$$\{z\}_1 = -[P]_1\{z\}_2 + \{x\}_1 \quad , \tag{6}$$

where the values in $[P]_1$ based upon the Euler approximation are defined in Reference 14. The higher order approximation defines a new $[P]_1$. This new $[P]_1$ is obtained by simultaneously solving the pole conditions

$$[DL]\{z\}_1 + [DG]\{z\}_2 + [DF]\{z\}_3 = \{0\}, \tag{7}$$

and the domain equation at station 2 next to the pole

$$[C]_2\{z\}_1 + [B]_2\{z\}_2 + [A]_2\{z\}_3 = \{g\}_2 \quad , \tag{8}$$

to eliminate $\{z\}_3$. Thus,

$$\{z\}_3 = [A]_2^{-1}(\{g\}_2 - [C]_2\{z\}_1 - [B]_2\{z\}_2). \tag{9}$$

Substituting equation (9) into equation (7) gives

$$[DL]\{z\}_1 + [DG]\{z\}_2 + [DF][A]_2^{-1}(\{g\}_2 - [C]_2\{z\}_1 -$$
$$[B]_2\{z\}_2) = 0. \tag{10}$$

Combining like coefficients of the {z} vector leads to

$$([DL] - [DF][A]_2^{-1}[C]_2)\{z\}_1 + ([DG] - [DF][A]_2^{-1}[B]_2)$$
$$\{z\}_2 = -[DF][A]_2^{-1}\{g\}_2. \tag{11}$$

Finally, solving for $\{z\}_1$ yields

$$\{z\}_1 = -[DL - DF \times A_2^{-1} \times C_2]^{-1} [DG - DF \times A_2^{-1} \times B_2] \{z\}_2$$

$$+ [DL - DF \times A_2^{-1} \times C_2]^{-1} [- DF \times A_2^{-1}] \{g\}_2. \qquad (12)$$

Thus, $[P]_1 = -[DL - DF \times A_2^{-1} \times C_2]^{-1} [DG - DF \times A_2^{-1} \times B_2]$ and

$\{x\}_1 = [DL - DF \times A_2^{-1} \times C_2]^{-1} [- DF \times A_2^{-1}] \{g\}_2$. The new $[P]_1$ matrix has been placed into the "PMATRX" subroutine of SATANS-IIA and the new $\{x\}_1$ vector has been placed in the "FORCE" subroutine.

A listing of the pole routine may be found in Appendix D. To incorporate this new routine into a SATANS-I or-II program, first proceed to the "PMATRX" subroutine and remove the fifteen cards that are between, but not including, "IF(NN.GT.2) GO TO 90" and "11 CONTINUE". These cards are located after statement number "14" and just before statement number "11". Replace the cards removed by the ones listed in Appendix D which read from" C IN PMATRX " to " 90 M3=MN". Then proceed to the "FORCE" subroutine and remove statement number "10". Replace statement number "10" with the nine cards listed in Appendix D which read from " C IN FORCE" to "DO 11 I= 1,4" . Also place " COMMON /IBL5/IBCINL, IBCFNL " into the common area of the " FORCE " subroutine.

This completes the implementation of the new pole routine into either SATANS-I or II.

IV. PROBLEM DESCRIPTION

The geometry of the shallow spherical shell used in this study is identical to that used in Reference 1. Briefly, the shallow shell can be specified by the non-dimensional parameter λ , where

$$\lambda = 2[\ 3\ (\ 1 - \nu^2\ )\ ]^{1/4}\ (\ H/\ h\ )^{1/2} . \tag{1}$$

H is the rise of the shell, h is the thickness, and ν is Poisson's ratio. The mass density of the shell is m. All shells analyzed had the following dimensions;

Radii of Curvature	$R_s = R_\theta = 250$ inches
Thickness	h = 0.25 inches
Modulus of Elasticity	E = 30,000,000 psi
Poisson's Ratio	$\nu = 0.3$

All buckling pressures obtained will be listed as a percent of the classical buckling pressure of a complete sphere, q_0, where

$$q_0 = [\ 2\ E\ (\ h/R_s)^2\ ]\ /\ [\ 3\ (\ 1 - \nu^2\ )\ ]^{1/2} \tag{2}$$

Forty stations were used over the meridian. The nondimensional time increment δ t, where

$$t = T\ /\ (\ R_s^2 m\ /\ E)^{1/2} , \tag{3}$$

was taken as 0.05 for 3000 time steps, which is a total nondimensional time of 150. In addition, the axisymmetric analysis was repeated with a larger time step of $\delta t = 0.2$ for a total time of 600. In this study m was selected such that t is equal to T. The necessity for the long response time is explained in Reference 6.

In the axisymmetric analysis only the N= 0 harmonic is considered. However, in the asymmetric analysis a second harmonic is excited by applying an incremental load in that harmonic. In addition, analyses of the shells λ = 6, 7.5, and 11 were made using five harmonics. The step pressure load for the axisymmetric harmonic is

$$\{q^{(0)}\} = P\, q_0\ \{1\}, \tag{4}$$

and the step pressure load for the asymmetric second harmonic is

$$\{q^{(n)}\} = P\, q_0\ \varepsilon^{(n)}\ \{1\}, \tag{5}$$

where $n > 0$, and $\varepsilon^{(n)}$ is taken as 0.0001. The value taken for the second harmonic in the asymmetric analysis was the same as the critical harmonic for the static buckling analysis presented by Stilwell and Ball [2]. When there was an uncertainty as to which was the critical static harmonic the two harmonics in question were both tested. Run times using SATANS-IIA with a two-harmonic analysis for 3000 time steps and 40 stations on the meridian took an average of 28 minutes on the IBM 360/67.

The parameter used to determine the minimum load at which dynamic buckling occurs is the peak value of $\bar{V}$, called

$\bar{V}_{MAX}$, where $\bar{V}$ is defined as

$$\bar{V} = \int_0^{r_0} r\, W^{(0)}\, dr \Big/ \int_0^{r_0} r\, \xi\, dr \qquad (6)$$

r is the normal distance from the axis to the shell, r_0 is the maximum value of r, $W^{(0)}$ is the normal displacement of the axisymmetric response and ξ is the vertical distance from the base plane to the undeformed shell. The $\bar{V}$ is a measure of the volume of the shell deformation. The Fortran statements computing $\bar{V}$ and $\bar{V}_{MAX}$ are given in Appendix E. When working a problem that requires these calculations the nineteen cards are inserted directly into the "DYNAMIC" subroutine right after the "IF" statement that calls the "OUTPUT" subroutine.

For convenience, the response in each asymmetric harmonic is also measured using equation (6), with $W^{(0)}$ replaced with $W^{(n)}$. The parameter $\bar{V}$ for the asymmetric harmonics does not represent a volume of deformation as it does for the axisymmetric harmonic. It can, however, be used to indicate the relative excitation of the asymmetric harmonics.

The buckling criterion for both the axisymmetric and the asymmetric dynamic buckling analysis defines the critical load as that load P where a very small increase in P causes a very large increase in $\bar{V}_{MAX}$. This is the same criterion

as that used in Ref. [1].

V. RESULTS AND DISCUSSION

A. STATIC AXISYMMETRIC BUCKLING ANALYSIS

Table I presents the new results from the static axisymmetric buckling analyses for λ = 4 through 13 using the new pole routine. The two upper curves in Figure 1 present a comparison of the new results obtained by SATANS-IIA with those obtained by Stilwell and Ball [2] using the SATANS-I program. As can be seen in this figure, fairly significant changes in the buckling load occurred in the neighborhood of λ = 4,5, and 9; and somewhat smaller differences occurred in the region λ = 10 through 13. The upper data points in Figure 2 present the comparison of the new results from SATANS-IIA with those obtained by Huang [4]. This comparison shows a very good agreement between the two sets of results, except for the largest values of λ. The new results have eliminated the differences that existed between the SATANS-I results and Huang's results.

B. DYNAMIC AXISYMMETRIC BUCKLING ANALYSIS

Figure 3 presents the new results for the peak value of $\bar{V}_{MAX}$ versus P for the various values of λ tested. Table II presents all of the new results for the dynamic axisymmetric buckling load. These loads are selected from figures constructed just like Figure 3. In every case,

except for $\lambda = 4$, a value of P slightly above the P_{CRIT} value caused a $\bar{\bar{V}}_{MAX}$ indicative of buckling, as well as a nonconvergence of the iterative solution procedure.

The lower two curves of Figure 1 present a comparison versus λ of the new axisymmetric dynamic buckling results with the previous buckling results obtained by Ball and Burt [1]. In every case the new critical pressure is lower than the critical pressure obtained using the Euler approximation at the pole.

The lower data points of Figure 2 present a comparison of the new results with those obtained by Huang [5], by Stephens and Fulton [6], and by Stricklin [8]. Just as in the case of the static axisymmetric buckling analysis, the new results compare much more favorably with the other results than did the results of Reference 1. It's interesting to note that the new results now tend to be slightly lower than the other results, whereas the results of Reference 1 were higher for almost all values of λ .

C. DYNAMIC ASYMMETRIC BUCKLING ANALYSIS

Table III presents the new results for the critical pressures obtained from the dynamic asymmetric analysis. The second harmonics, or critical static harmonics, used in the analyses are also presented in Table III. A comparison of the critical pressures from the asymmetric analyses, Table III, with the critical pressures from the axisymmetric analyses, Table II, reveals that only the shell $\lambda = 6$ buckled at a load below the axisymmetric buckling load. For the shell $\lambda = 7$ the critical buckling load was slightly

larger when asymmetric motion was considered. In all other cases the buckling was not influenced by the presence of the second harmonic. These new buckling results and those by Ball and Burt [2] are plotted in Figure 4. The new results can be seen to be significantly different from the SATANS-I results, where the asymmetric buckling loads were lower than the axisymmetric loads for five out of the ten values of tested.

Except for λ = 6 and 7, the relationship between $\bar{V}_{MAX}$ and P for the N= 0 harmonic, in the two-harmonic analyses, was found to be essentially identical to the relationship found in the axisymmetric buckling analysis shown in Figure 3. Table IV A presents the $\bar{V}_{MAX}$ versus P data for both the N= 0 harmonic and the second harmonic, for all values of λ tested, except for λ = 6. Note that, except for λ =7 and 11, $\bar{V}_{MAX}$ for the asymmetric harmonic is generally very small, even when the $\bar{V}_{MAX}$ for the N= 0 harmonic indicates that the shell has buckled. Thus, except for the shells λ = 6 and 7, the presence of the asymmetric motion does not influence the axisymmetric motion, and except for the shells λ = 6, 7 and 11 the asymmetric motion is very small prior to buckling in the axisymmetric harmonic.

A more detailed analysis of the shell λ = 6 has been conducted since it was the only shell that revealed any significant axisymmetric sensitivity to asymmetric motion. This shell was studied using two two-harmonic analyses (N= 0, 1 and N= 0, 2) and a five-harmonic analysis (N= 0, 1, 2, 3, and 4). Figure 5 and Tables IV B and IV C contain values of $\bar{V}_{MAX}$ versus P for both of the asymmetric harmonics, N= 1

and N= 2, in the two two-harmonic analyses, as well as the values of $\bar{V}_{MAX}$ for the axisymmetric harmonic, N= 0. Figure 6 and Table IV D present the values of $\bar{V}_{MAX}$ versus P for the N= 0,1,2,3, and 4 harmonics from the five-harmonic study. A comparison of the critical buckling load predicted from the results of the two two-harmonic analyses in Figure 5 with the critical load from the five-harmonic analysis obtained from Figure 6 shows that the presence of the additional harmonics results in the shell buckling at a slightly lower load (0.50), with significant motion in the N= 1 harmonic instead of the N= 2 harmonic (see the nonconverged solution at P= 0.51), which is the critical harmonic for static asymmetric buckling. Studies using five harmonics have also been conducted for λ = 7.5 and λ = 11. As can be seen in Table IV D the critical harmonic for λ = 7.5 remained N= 3; however, significant motion occurred in that harmonic at P= .41 and .44. In the case of λ = 11, relatively large asymmetric motion occurred in the asymmetric mode of N= 5 vice 6 at a value of P= .46.

The comparison of the new results for the critical pressure for dynamic asymmetric buckling with those obtained analytically by Stricklin [8], by Akkas [9], and experimentally by Lock et al [7] is illustrated in Figure 7. The comparison reveals an agreement with Stricklin in every case, in general a higher value of P_{CRIT} than those obtained by Akkas, and most importantly a very good agreement with Lock's experimental results.

When making the comparison between the new results and those obtained by Akkas, it is necessary to look at the differences in the problem solution parameters used in the two studies. For example, buckling results obtained from SATANS-IIA using the same time increment as used by Akkas,

$\delta t = .2$ for 3000 time steps, were significantly higher than those using the time step of $\delta t = .05$ for many values of λ. Furthermore, the new results had , in some cases, instances of buckling occurring as far out in time as 130. Akkas, to shorten computer run times, observed the cap only for a time of less than 5. Furthermore, only the harmonics N= 1 or 2 or 3 were studied by Akkas for shells λ = 5 through 12. If the critical harmonic is not studied, the predicted load will be too high. Thus, it appears that Akkas' lower bound loads may not be true lower bounds.

Two additional features of the shell response should be noted. First, shells λ = 6, 7.5, and 11 exhibited a non-buckled response in the axisymmetric harmonic to a load larger than the defined critical buckling load. This can be seen in Tables IV A and IV C. Second, and most importantly, the buckling load proposed by Ball and Burt [1], and used here, defines buckling to occur when the $\bar{V}_{MAX}$ in the axisymmetric harmonic undergoes a large change due to a small change in P. Another criterion for dynamic buckling in the asymmetric analysis discussed in Reference 1 is to define the buckling load as that threshold load that initiates significant growth in the asymmetric harmonic. Re-examination of the $\bar{V}_{MAX}$ versus P data in Table IV A through D reveals that shells λ = 6, 7, and 11 exhibited relatively large asymmetric motion at loads smaller that the defined buckling load when compared with other $\bar{V}_{MAX}$ values for those shells, even though the numbers themselves were small when compared with the axisymmetric harmonic. Shells λ =7.5 and 12 appear to be borderline cases. If the alternate criterion for buckling is used, the critical buckling loads for shells λ = 6, 7, and 11 become 0.47, 0.45, and 0.45, respectively. The shells λ = 7.5 and 12 could have buckling

loads as low as 0.40 and 0.44, respectively. These values are more conservative than the definition based upon axisymmetric response. These five shells are the same five shells that exhibited an asymmetric buckling load lower than the axisymmetric buckling load in Reference 1.

VI. SUMMARY AND CONCLUSIONS

A digital computer program for the geometrically nonlinear analysis of totally arbitrarily loaded shells of revolution (SATANS-II) was modified to more accurately account for the conditions at the pole of the shell. This program, called SATANS-IIA, was used to determine the buckling load of shallow spherical shells of various sizes when subjected to static axisymmetric, dynamic axisymmetric, and dynamic nearly axisymmetric step-pressure loads of infinite duration. The cap sizes ranged from $\lambda = 4$ to 13 including $\lambda = 7.5$. A comparison was made between the new buckling results with the improved pole handling routine and the results that did not have the new pole routine. The comparison revealed a significant change in buckling pressures, due solely to the change from an order Δ finite difference approximation of the first derivatives at the pole to an approximation of order Δ^2. These new critical pressures are in very good agreement with the results from other studies of the same spherical shells. This good agreement with other results, which came about as a result of the modification of the pole handling routine, is a strong indication that the manner in which the pole condition is handled is vital to the accuracy of the solutions obtained.

In the asymmetric analysis, two harmonics were included for most of the shells; the axisymmetric harmonic and one asymmetric harmonic. Five-harmonic analyses were conducted for three of the shells. Two buckling criteria for the

asymmetric analysis were considered. One defined buckling as that threshold load that caused a large increase in a deformation parameter, $\bar{V}_{MAX}$, in the axisymmetric harmonic. The other, more conservative than the first, defined buckling as that threshold load that caused a large increase in the $\bar{V}_{MAX}$ value for the asymmetric harmonic. Both values have been presented.

The new static axisymmetric, dynamic axisymmetric, and even the dynamic asymmetric critical buckling pressure loads appear to be fairly reliable results for perfect, shallow shells. The effect of realistic imperfections remains to be determined.

      SUBROUTINE MODES (IS,JS,ID,JD,P,X,ZO,Z2,Z3,DEE,DST)
C*********************************************************************
C          IN THIS SUBROUTINE, ARRAYS THAT DEFINE THOSE SETS OF INDICES  *
C          THAT COMBINE TO EQUAL EACH VALUE OF N IN THE PROBLEM ARE DETER*
C          MINED.  MODES IS CALLED PRIOR TO THE FIRST ITERATION AND AFTER*
C          EVERY ITERATION UNTIL A SPECIFIED NUMBER OF FOURIER TERMS IS  *
C          REACHED.  EACH FOURIER INDEX IN THE PROBLEM IS SUBTRACTED FROM*
C          ALL OTHER FOURIER INDICES AND THE RESULT IS COMPARED WITH ALL *
C          FOURIER INDICES TO SEE IF THE NEW VALUE EXISTS IN THE PROGRAM.*
C          IF IT DOES, THE LOCATIONS OF THE TWO INDICES THAT MADE THE COM-
C          BINATION ARE STORED IN TWO SPECIAL 2-DIMENSIONAL ARRAYS, ID AND
C          JD.  ONE ARGUMENT OF EACH ARRAY IS THE VALUE OF THE NEW INDEX *
C          AND THE OTHER IS THE NUMBER OF COMBINATIONS OF INDICES THAT   *
C          ALSO GIVE THIS VALUE OF THE INDEX.  IF THERE IS NO INDEX IN THE
C          PROGRAM THAT MATCHES THE NEW ONE, THEN A NEW FOURIER TERM HAS *
C          BEEN GENERATED AND WILL BE CONSIDERED IN THE NEXT ITERATION FOR
C          SOLUTION.                                                     *
C          THE VARIABLE MAXD STORES THE TOTAL NUMBER OF SUCH COMBINATIONS*
C          FOR EACH VALUE OF THE FOURIER INDEX.  IN A SIMILAR MANNER, EACH
C          INDEX IS ADDED TO EVERY OTHER INDEX AND THE SUM COMPARED WITH *
C          ALL INDICES.  THIS RESULT IS STORED IN THE 2-DIMENSIONAL ARRAYS
C          IS AND JS, IN THE SAME MANNER AS WAS DONE FOR THE SUBTRACTION *
C          CASE.  THE VARIABLE MAXS STORES THE TOTAL NUMBER OF SUMMATION *
C          COMBINATIONS FOR EACH VALUE OF THE FOURIER INDEX.             *
C          A SPECIAL ROUTINE HANDLES THE CASES WHERE THE INDEX IS ADDED TO
C          AND SUBTRACTED FROM ITSELF.  THE 2-DIMENSIONAL ARRAY IJS STORES
C          THE LOCATION OF THE INDEX AND THE VARIABLE MAXSY STORES THE   *
C          TOTAL NUMBER OF SUCH COMBINATIONS.                            *
C          WITH THIS PROCEDURE, THE SERIES OF PRODUCTS THAT MAKE UP THE  *
C          BETA'S AND AETA'S CONTAIN NO ZERO TERM, AND THE SUMMATION IS  *
C          CARRIED OUT IN PHIBET(K) AND TEAETA(K) OVER SPECIFICALLY DE-  *
C          FINED LIMITS.                                                 *

APPENDIX C

INPUT DATA GUIDE FOR SATANS-IIA

INPUT DATA GUIDE FOR SATANS-I, SATANS-II, AND SATANS-IIA

CARD	COLUMNS	FORMAT	ITEM	EXAMPLE	MEANING
1	1-72	18A4	TITLE	-	ENTER ANY 72 CHARACTERS
2	1-5	I5	NO	1	THE PROBLEM NUMBER, 0<NO<10000.
2	6-10	L5	$DYNAMC	F	FOR A STATIC ANALYSIS, SET $DYNAMC = F.
				T	FOR A DYNAMIC ANALYSIS, SET $DYNAMC = T.
2	11-15	I5	IMODE	0	FOR NO MODAL OUTPUT DATA
				1	FOR MODAL OUTPUT DATA.
2	16-20	I5	NDIMEN	0	DIMENSIONAL OUTPUT DATA.
				1	NONDIMENSIONAL OUTPUT.
2	21-25	I5	NTHMAX	8	SUMMED SOLUTION WILL BE PRINTED AT NTHMAX MERIDIANS, 0<=NTHMAX<=36.
2	26-30	I5	IFREQ	2	SOLUTION WILL BE PRINTED AT THE FIRST STATION, EVERY SUBSEQUENT IFREQ STATION AND THE LAST STATION, 0<IFREQ<=KMAX.
2	31-35	I5	IPRINT	3	EVERY IPRINT CONVERGED SOLUTION WILL BE PRINTED.
2	36-40	I5	IBCINL	-1	IF THE SHELL HAS A POLE AT THE FIRST STATION.
				0	IF THE SHELL HAS NO POLE AT THE FIRST STATION.
2	41-45	I5	IBCFNL	-1	IF THE SHELL HAS A POLE AT THE LAST STATION.
				0	IF THE SHELL HAS NO POLE AT THE LAST STATION.

CARD	COLUMNS	FORMAT	ITEM	EXAMPLE	MEANING
2	46-50	I5	KMAX	35	NUMBER OF MERIDIONAL STATIONS. NOTE: KMAX<201 FOR SATANS-I WITHOUT PLOTS AND KMAX<101 FOR SATANS-I WITH PLOTS OR FOR SATANS-II. SATANS-IIA IS UNLIMITED.
2	51-55	I5	MNMAX	7	NUMBER OF SERIES COEFFICIENTS USED TO DESCRIBE THE INITIAL CONDITIONS, PRESSURE AND THERMAL LOADS (AND INITIAL IMPERFECTIONS IF USING SATANS-II OR IIA). MNMAX<=MAXM.
2	56-60	I5	MAXM	7	MAX NUMBER OF HARMONICS IN THE SOLUTION, LIMITED TO 99.
2	61-65	I5	LSMAX	1	FOR A LINEAR ANALYSIS.
				99	USE MANY LOAD STEPS FOR A NONLINEAR STATIC ANALYSIS.
				3000	FOR A DYNAMIC ANALYSIS, LSMAX IS THE NUMBER OF TIME INCREMENTS, WHERE LSMAX= T MAX/ΔT.
2	66-70	I5	LCHMAX	2	THE NUMBER OF LOAD STEP SIZE REDUCTIONS IN A STATIC ANALYSIS, RECOMMENDED RANGE = 2-4.
				0	FOR A DYNAMIC ANALYSIS.
2	71-75	I5	ITRMAX	1	FOR A LINEAR ANALYSIS.
				30	THE NUMBER OF ITERATIONS AT A LOAD OR TIME STEP. FOR A NONLINEAR ANALYSIS, SUGGESTED RANGE = 10-30, UP TO 50 FOR SPECIAL CASES.
2	76-80	I5	IC	0	INITIAL CONDITIONS. SET TO 0 FOR A STATIC ANALYSIS, OR FOR A DYNAMIC ANALYSIS WHERE THE SHELL IS AT REST AT T= 0.
				1	FOR A DYNAMIC ANALYSIS WITH INITIAL CONDITIONS.

CARD	COLUMNS	FORMAT	ITEM	EXAMPLE	MEANING
3	1-12	E12.3	NU	0.3	POISSON'S RATIO, ν.
3	12-24	E12.3	SIGO	1000.0	REFERENCE STRESS LEVEL, σ_0.
				1.0	IF THE INPUT DATA IS DIMENSIONAL.
3	24-36	E12.3	ELAST	.3E8	REFERENCE MODULUS OF ELASTICITY, E_0.
				1.0	IF THE INPUT DATA IS DIMENSIONAL.
3	37-48	E12.3	TKN	.4E-2	REFERENCE THICKNESS, h_0.
				1.0	IF THE INPUT DATA IS DIMENSIONAL.
3	49-60	E12.3	CHAR	8.16	CHARACTERISTIC SHELL DIMENSION, a.
				1.0	IF THE INPUT DATA IS DIMENSIONAL.
3	61-72	E12.3	TEEO	0.0	IF A STATIC ANALYSIS.
				.996E-5	REFERENCE TIME, T_0.
4	1-12	E12.3	DELOAD	0.2	FOR A STATIC ANALYSIS, DELOAD IS THE LOAD INCREMENT. IT REMAINS UNCHANGED UNTIL THE SOLUTION FAILS TO CONVERGE IN ITERMAX ITERATIONS, WHEN IT IS REDUCED BY A FACTOR OF FIVE. A MAXIMUM OF LCHMAX SUCH REDUCTIONS WILL OCCUR.
				.1823E-6	FOR A DYNAMIC ANALYSIS, DELOAD IS THE NONDIMENSIONAL TIME INCREMENT.
4	13-24	E12.3	EPS	0.01	THE CONVERGENCE CRITERION RECOMMENDED RANGE OF 0.01<EPS<0.001.

CARD 4A IS ONLY INCLUDED FOR A SATANS-II OR SATANS-IIA RUN.

4A	1-5	I5	JUMP	1	FOR AN ANALYSIS USING SINGLE SERIES EXPANSIONS.
				2	FOR AN ANALYSIS USING DOUBLE SERIES EXPANSIONS.
4A	5-10	I5	MPERFS	0	AN ANALYSIS WITHOUT IMPERFECTIONS.
				1	AN ANALYSIS WITH IMPERFECTIONS. NOTE: IF JUMP=2, MPERFS MAY BE 0 OR 1. IF JUMP =1, MPERFS MUST BE 0. IF MPERFS=1, JUMP MUST BE 2.

CARC	CCLUMN	FCRMAT	ITEM	EXAMPLE	MEANING

INCLLDE AS MANY CARDS 5 AS NECESSARY TC SPECIFY NTHMAX MERICIANS. IF NTHMAX EQUALS 0, OMIT CARC 5.

5	1-72	6E12.3		10.0	A LIST OF CIRCLMFERENTIAL COCRCINATES θ, IN CEGREES ANC TENTHS, WHERE THE SCLUTICN PRINTCUT IS CE-SIREC. THE LIST MUST HAVE NTHMAX ENTRIES.

IF IBCINL= -1, CMIT CARDS 6 THROUGH 14. IF IBCFNL= -1, CMIT CARCS 15 THROUGH 23. CARDS 6 THROUGH 23 DESCRIBE THE BCUNCARY CCNDITICNS AT THE FIRST, ANC THEN AT THE LAST STA-TICN. THE BOUNDARY CONDITIONS EXIST CN THE TOTAL VARIABLES, NCT CN THE INCIVIDUAL HARMONICS. LOACINGS APPLIEC THROUGH SPECIFICATION CF BOUNDARY CCNDITICNS ARE TAKEN IN THE ZERC-ETH HARMCNIC (N=0) ONLY, AS THE COLUMN MATRIX $\{\ell\}$ IS SET TC ZERC FOR HARMCNICS GREATER THAN ZERO. THE BOUNCARY CON-DITICNS ARE DIMENSIONAL. THE FORMAT CF CARDS 6 THRCUGH 23 IS 4E16.8.

CARC 6,15 CARD 7,16 CARD 8,17 CARD 9,18

$$\begin{bmatrix} \Omega(1,1) & \Omega(1,2) & \Omega(1,3) & \Omega(1,4) \\ \Omega(2,1) & \Omega(2,2) & \Omega(2,3) & \Omega(2,4) \\ \Omega(3,1) & \Omega(3,2) & \Omega(3,3) & \Omega(3,4) \\ \Omega(4,1) & \Omega(4,2) & \Omega(4,3) & \Omega(4,4) \end{bmatrix} \begin{bmatrix} N_s \\ N_{s\theta} \\ Q_s \\ \phi_s \end{bmatrix} +$$

CARC 10,19 CARD 11,20 CARD 12,21 CARC 13,22 CARC 14,23

$$\begin{bmatrix} \Lambda(1,1) & \Lambda(1,2) & \Lambda(1,3) & \Lambda(1,4) \\ \Lambda(2,1) & \Lambda(2,2) & \Lambda(2,3) & \Lambda(2,4) \\ \Lambda(3,1) & \Lambda(3,2) & \Lambda(3,3) & \Lambda(3,4) \\ \Lambda(4,1) & \Lambda(4,2) & \Lambda(4,3) & \Lambda(4,4) \end{bmatrix} \begin{bmatrix} U \\ V \\ W \\ M_s \end{bmatrix} = \begin{bmatrix} \ell(1) \\ \ell(2) \\ \ell(3) \\ \ell(4) \end{bmatrix}$$

CARC 24 IS:

1. INCLUDED FOR A SATANS-I STATIC ANALYSIS.
2. INCLUDED BUT BLANK FCR A SATANS-I DYNAMIC ANALYSIS.
3. CMITTEC FCR A SATANS-II ANALYSIS.
4. INCLUDEC BLANK FOR DYNAMIC USED FCR STATIC SATANS-IIA ANALYSES.

CARC	CCLUMN	FCRMAT	ITEM	EXAMPLE	MEANING
24	1-2	L2	$PLOTS	F	INDICATES PLCTS ARE NCT DESIRED.
				T	INCICATES PLCTS ARE DESIRED.
24	3-4	L2	$MCDAL	F	INDICATES PLCTS ARE FCR SUMMED SOLUTICNS ONLY.
				T	INCICATES PLCTS ARE FCR MODAL SOLUTICNS CNLY.

FOR THE REMAINDER OF CARD 24 ENTRIES, 0 INDICATES THAT NO PLOTS ARE DESIRED FOR THE PARTICULAR ITEM, AND 1 INDICATES THAT THEY ARE DESIRED. ALL GRAPHS ARE PLOTTED AS THE INDICATED ITEM VERSUS THE STATION NUMBER. IF A COMPLETE PLOT IS DESIRED, INSUTE IFREQ = 1.

CARD	COLUMN	FORMAT	ITEM	EXAMPLE	MEANING
24	5- 6	I2	IRADII	1	PLOT THE RADII AS COMPUTED BY SUBROUTINE GEOM.
24	7- 8	I2	IGAMMA	1	PLOT ρ'/ρ AS COMPUTED BY SUBROUTINE GEOM.
24	9-10	I2	IOMEGS	1	PLOT ω_s AS COMPUTED BY SUBROUTINE GEOM.
24	11-12	I2	IOMEGT	1	PLOT ω_θ AS COMPUTED BY SUBROUTINE GEOM.
24	13-14	I2	IDECMS	1	PLOT ω_s' AS COMPUTED BY SUBROUTINE GEOM.
24	15-16	I2	IBSTIF	1	PLOT THE STIFFNESS D AS COMPUTED BY SUBROUTINE BDB.
24	17-18	I2	IDSTIF	1	PLOT THE STIFFNESS D AS COMPUTED BY THE SUBROUTINE BDB.
24	19-20	I2	IBBSTF	1	PLOT THE STIFFNESS db/ds AS COMPUTED BY SUBROUTINE BDB.
24	21-22	I2	IDDSTF	1	PLOT THE STIFFNESS dd/ds AS COMPUTED BY SUBROUTINE BDB.
24	23-24	I2	IPR	1	PLOT THE NORMAL COMPONENT OF THE PRESSURE LOAD.
24	25-26	I2	IPS	1	PLOT THE MERIDIONAL COMPONENT OF THE PRESSURE LOAD.
24	27-28	I2	IPT	1	PLOT THE CIRCUMFERENTIAL COMPONENT OF THE PRESSURE LOAD.
24	29-30	I2	ITT	1	PLOT THE THERMAL LOAD.
24	31-32	I2	IMT	1	PLOT THE THERMAL MOMENT.
24	33-34	I2	IDTT	1	PLOT d/ds OF THE THERMAL LOAD.
24	35-36	I2	IDMT	1	PLOT d/ds OF THE THERMAL MOMENT.
24	37-38	I2	INS	1	PLOT THE MERIDIONAL MEMBRANE FORCE DISTRIBUTION.

CARD	COLUMN	FORMAT	ITEM	EXAMPLE	MEANING
24	39-40	I2	INTH	1	PLOT THE CIRCUMFERENTIAL MEMBRANE FORCE DISTRIBU-TION.
24	41-42	I2	INSTH	1	PLOT THE MERIDIO-CIRCUMFERENTIAL MEMBRANE FORCE DISTRIBUTION.
24	43-44	I2	IQS	1	PLOT THE TRANSVERSE FORCE DISTRIBUTION.
24	45-46	I2	IMS	1	PLOT THE MERIDIONAL MOM-ENT DISTRIBUTION.
24	47-48	I2	IMTH	1	PLOT THE CIRCUMFERENTIAL MOMENT DISTRIBUTION.
24	49-50	I2	IMSTH	1	PLOT THE MERIDIO-CIRCUMFERENTIAL MOMENT DISTRIBUTION.
24	51-52	I2	IU	1	PLOT THE MERIDIONAL DIS-PLACEMENT DISTRIBUTION.
24	53-54	I2	IV	1	PLOT THE CIRCUMFERENTIAL DISPLACEMENT DISTRI-BUTION.
24	55-56	I2	IW	1	PLOT THE NORMAL DISPLACE-MENT DISTRIBUTION.
24	57-58	I2	IPHIS	1	PLOT THE MERIDIONAL ROTA-TION DISTRIBUTION.
24	59-60	I2	IPHIT	1	PLOT THE CIRCUMFERENTIAL ROTATION DISTRIBUTION.
24	61-62	I2	IPHI	1	PLOT THE MERIDIO-CIRCUMFERENTIAL ROTATION DISTRIBUTION.

INSERT IMPERFECTION DATA HERE FOR A SATANS-II OR SATANS-IIA ANALYSIS WITH IMPERFECTIONS. INSURE FORMAT OF THE IMPERFEC-TION DATA IS COMPATIBLE WITH THAT SPECIFIED IN THE USER-WRITTEN SUBROUTINE IMPERF.

CARD	COLUMN	FORMAT	ITEM	EXAMPLE	MEANING
25	1-2	I2	IRNAGN	0	INDICATES THIS IS THE ONLY RUN.
				1	INDICATES ANOTHER RUN IS TO BE MADE. ADD ANOTHER COMPLETE SET OF DATA CARDS AFTER THIS CARD IS IRNAGN= 1.

APPENDIX D

LISTING OF NEW POLE ROUTINE FOR SATANS-IIA

THE FOLLOWING CARDS ARE TO BE PLACED INTO THE FORCE SUBROUTINE

```
      COMMON /IBL5/IBCINL,IBCFNL
```

```
C    IN FORCE
   10 IF(K.NE.2.OR.(K.EQ.2.AND.IBCINL.GE.0)) GO TO 901
